ABSTRACT. In this appendix we present an expanded version of Section 4 of our paper [JR], including the proofs of all of the technical lemmas.

1. INTRODUCTION

This paper is an appendix to our paper [JR]. Here, we present an expanded version Section 4 of [JR] including detailed proofs of the all of the technical lemmas. Throughout this appendix, we will use the following notation. Let F be a nonarchimedean local field of characteristic zero, with ring of integers \mathfrak{o} and generator ϖ of the maximal ideal \mathfrak{p} of \mathfrak{o} . We let q be the number of elements of $\mathfrak{o}/\mathfrak{p}$ and use the absolute value on F such that $|\varpi| = q^{-1}$. We use the Haar measure on the additive group F that assigns \mathfrak{o} measure 1 and the Haar measure on the multiplicative group F^\times that assigns \mathfrak{o}^\times measure $1 - q^{-1}$. We χ be a quadratic character of F^\times of conductor \mathfrak{p} . Let

$$J' = \begin{bmatrix} & & & 1 \\ & & 1 & \\ & -1 & & \\ -1 & & & \end{bmatrix}.$$

For this section only, we define $\mathrm{GSp}(4, F)$ as the subgroup of all $g \in \mathrm{GL}(4, F)$ such that ${}^t g J' g = \lambda(g) J'$ for some $\lambda(g) \in F^\times$ called the multiplier of g . For n a non-negative integer, we let $K(\mathfrak{p}^n)$ be the subgroup of $k \in \mathrm{GSp}(4, F)$ such that $\lambda(k) \in \mathfrak{o}^\times$ and

$$k \in \begin{bmatrix} \mathfrak{o} & \mathfrak{o} & \mathfrak{o} & \mathfrak{p}^{-n} \\ \mathfrak{p}^n & \mathfrak{o} & \mathfrak{o} & \mathfrak{o} \\ \mathfrak{p}^n & \mathfrak{o} & \mathfrak{o} & \mathfrak{o} \\ \mathfrak{p}^n & \mathfrak{p}^n & \mathfrak{p}^n & \mathfrak{o} \end{bmatrix}.$$

Throughout this section, (π, V) is a smooth representation of $\mathrm{GSp}(4, F)$ for which the center acts trivially. If n is a non-negative integer, then $V(n)$ is the subspace of vectors fixed by the paramodular subgroup $K(\mathfrak{p}^n)$; also, we let $V(n, \chi)$ be the subspace of vectors $v \in V$ such that $\pi(k)v = \chi(\lambda(k))v$ for $k \in K(\mathfrak{p}^n)$. Finally, let

$$\eta = \begin{bmatrix} \varpi^{-1} & & & \\ & 1 & & \\ & & 1 & \\ & & & \varpi \end{bmatrix}, \quad \tau = \begin{bmatrix} 1 & & & \\ & \varpi^{-1} & & \\ & & \varpi & \\ & & & 1 \end{bmatrix}, \quad t_4 = \begin{bmatrix} & & & -\varpi^{-4} \\ & 1 & & \\ & & 1 & \\ \varpi^4 & & & \end{bmatrix}.$$

Usually, we will write η and τ for $\pi(\eta)$ and $\pi(\tau)$, respectively.

In [JR1] we constructed a twisting map,

$$T_\chi : V(0) \rightarrow V(4, \chi), \tag{1}$$

given by

$$T_\chi(v) = q^3 \int_{\mathfrak{o}} \int_{\mathfrak{o}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(ab) \pi \left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & x & 1 & \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & -a\varpi^{-1} & b\varpi^{-2} & z\varpi^{-4} \\ & 1 & & b\varpi^{-2} \\ & & 1 & a\varpi^{-1} \\ & & & 1 \end{bmatrix} \right) \tau v \, da \, db \, dx \, dz \quad (\text{P1})$$

$$+ q^3 \int_{\mathfrak{o}} \int_{\mathfrak{p}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(ab) \pi \left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & -1 & 1 & \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & & & \\ & 1 & & \\ & y & 1 & \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & -a\varpi^{-1} & b\varpi^{-2} & z\varpi^{-4} \\ & 1 & & b\varpi^{-2} \\ & & 1 & a\varpi^{-1} \\ & & & 1 \end{bmatrix} \right) \tau v \, da \, db \, dy \, dz \quad (\text{P2})$$

$$+ q^2 \int_{\mathfrak{o}} \int_{\mathfrak{o}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(ab) \pi(t_4 \begin{bmatrix} 1 & & & \\ & 1 & & \\ & x & 1 & \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & -a\varpi^{-1} & b\varpi^{-2} & z\varpi^{-3} \\ & 1 & & b\varpi^{-2} \\ & & 1 & a\varpi^{-1} \\ & & & 1 \end{bmatrix}) \tau v \, da \, db \, dx \, dz \quad (\text{P3})$$

$$+ q^2 \int_{\mathfrak{o}} \int_{\mathfrak{p}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(ab) \pi(t_4 \begin{bmatrix} 1 & & & \\ & 1 & & \\ & -1 & 1 & \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & & & \\ & 1 & & \\ & y & 1 & \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & -a\varpi^{-1} & b\varpi^{-2} & z\varpi^{-3} \\ & 1 & & b\varpi^{-2} \\ & & 1 & a\varpi^{-1} \\ & & & 1 \end{bmatrix}) \tau v \, da \, db \, dy \, dz. \quad (\text{P4})$$

Remark 1.1. The Iwasawa decomposition asserts that $\mathrm{GSp}(4, F) = B \cdot \mathrm{GSp}(4, \mathfrak{o})$ where B is the Borel subgroup of upper-triangular matrices in $\mathrm{GSp}(4, F)$. Hence, if $v \in V(0)$ so that v is invariant under $\mathrm{GSp}(4, \mathfrak{o})$, then it is possible to obtain a formula for $T_\chi(v)$ involving only upper-triangular matrices. The remainder of this section will be devoted to calculating formulas for the terms (P1), (P2), (P3), (P4) involving only upper-triangular matrices. The resulting formula for $T_\chi(v)$ is given in the following theorem. The proof of this theorem is spread over four sections of technical lemmas. In some cases, we directly provide an Iwasawa identity $g = bk$ where $g \in \mathrm{GSp}(4, F)$, $b \in B$, and $k \in \mathrm{GSp}(4, \mathfrak{o})$. In many cases, we are able to obtain an appropriate Iwasawa identity by using the following formal matrix identity

$$\begin{bmatrix} 1 & \\ x & 1 \end{bmatrix} = \begin{bmatrix} 1 & x^{-1} \\ & 1 \end{bmatrix} \begin{bmatrix} -x^{-1} & \\ & -x \end{bmatrix} \begin{bmatrix} & 1 \\ -1 & \end{bmatrix} \begin{bmatrix} 1 & x^{-1} \\ & 1 \end{bmatrix}. \quad (2)$$

Both methods will require that we decompose the domains of integration in an advantageous manner. The assumptions on the character, $\chi \neq 1$, $\chi^2 = 1$ and $\chi(1 + \mathfrak{p}) = 1$, also play a significant role in the computations.

Theorem 1.2. *Let $v \in V(0)$. Then the twisting operator (1) is given by the formula*

$$T_\chi(v) = \sum_{k=1}^{14} T_\chi^k(v)$$

where

$$T_\chi^1(v) = q^2 \int_{\mathfrak{o}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(ab) \pi \left(\begin{bmatrix} 1 & -(a + xb)\varpi^{-1} & & \\ & 1 & & \\ & & 1 & (a + xb)\varpi^{-1} \\ & & & 1 \end{bmatrix} \right)$$

\end{aligned}$$

For the remainder of the proof, we will simplify by combining pairs of terms and rewriting certain domains. First we combine the terms involving $\eta^2\tau^{-2}$.

$$\begin{aligned}
& q\chi(-1)\eta^2\tau^{-2} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(b)\pi\left(\begin{bmatrix} 1 & a\varpi^{-2} & b\varpi^{-1} \\ & 1 & x\varpi^{-4} & a\varpi^{-2} \\ & & 1 & \\ & & & 1 \end{bmatrix}\right) v \, da \, db \, dx \\
& + \eta^2\tau^{-2} \int_{\mathfrak{o}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(a)\pi\left(\begin{bmatrix} 1 & b\varpi^{-2} & -a\varpi^{-1} \\ & 1 & y\varpi^{-3} & b\varpi^{-2} \\ & & 1 & \\ & & & 1 \end{bmatrix}\right) v \, da \, db \, dy \\
& = q\chi(-1)\eta^2\tau^{-2} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(b)\pi\left(\begin{bmatrix} 1 & a\varpi^{-2} & b\varpi^{-1} \\ & 1 & x\varpi^{-4} & a\varpi^{-2} \\ & & 1 & \\ & & & 1 \end{bmatrix}\right) v \, da \, db \, dx \\
& + q\chi(-1)\eta^2\tau^{-2} \int_{\mathfrak{p}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(a)\pi\left(\begin{bmatrix} 1 & b\varpi^{-2} & a\varpi^{-1} \\ & 1 & y\varpi^{-3} & b\varpi^{-2} \\ & & 1 & \\ & & & 1 \end{bmatrix}\right) v \, da \, db \, dy \\
& = q\chi(-1)\eta^2\tau^{-2} \int_{\mathfrak{o}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(b)\pi\left(\begin{bmatrix} 1 & a\varpi^{-2} & b\varpi^{-1} \\ & 1 & x\varpi^{-4} & a\varpi^{-2} \\ & & 1 & \\ & & & 1 \end{bmatrix}\right) v \, da \, db \, dx.
\end{aligned}$$

Similarly, we combine the terms involving $\eta\tau^{-1}$,

$$\begin{aligned}

We rewrite one of the terms involving η after making the observation that if $z \in \mathfrak{o}^\times - (1 + \mathfrak{p})$ and f is a locally constant function on \mathfrak{o}^\times , then

$$\int_{\mathfrak{o}^\times - A(z)} f(x) dx = \int_{\mathfrak{o}^\times - (1 + \mathfrak{p})} f((z^{-1} - 1)(w^{-1} - 1)^{-1}) dw.$$

Hence

Finally, we are able to eliminate the factor $\chi(-1)$ from all terms using an appropriate change of variables. Substituting the simplified terms into the formula for $T_\chi(v)$, we obtain the result. \square

This completes the calculation of the second term (P2). \square

4. CALCULATION OF THE THIRD PART (P3)

The calculation of the (P3) term is the most delicate. We begin this calculation with a preparatory lemma which breaks the term into four pieces. The majority of this section will be devoted to handling the first of these terms.

Lemma 4.1. *If $v \in V(0)$, then we have that (P3) is given by*

$$q^2 \int_{\mathfrak{o}} \int_{\mathfrak{o}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(ab) \pi(t_4 \begin{bmatrix} 1 & & & \\ & 1 & & \\ & x & 1 & \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & -a\varpi^{-1} & b\varpi^{-2} & z\varpi^{-3} \\ & 1 & & b\varpi^{-2} \\ & & 1 & a\varpi^{-1} \\ & & & 1 \end{bmatrix}) \tau v da db dx dz$$

$$= q^2 \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(b) \eta \pi \left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x\varpi^{-2} & a\varpi^{-2} & b\varpi^{-3} \\ & 1 & & a\varpi^{-2} \\ & & 1 & -x\varpi^{-2} \\ & & & 1 \end{bmatrix} \right) v \, da \, db \, dx \, dz \quad (3)$$

$$+ q \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(b) \eta \pi \left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^4 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x\varpi^{-2} & a\varpi^{-2} & b\varpi^{-3} \\ & 1 & & a\varpi^{-2} \\ & & 1 & -x\varpi^{-2} \\ & & & 1 \end{bmatrix} \right) v \, da \, db \, dx \, dz \quad (4)$$

$$+ \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(b) \eta \pi \left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^5 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x\varpi^{-2} & a\varpi^{-2} & b\varpi^{-3} \\ & 1 & & a\varpi^{-2} \\ & & 1 & -x\varpi^{-2} \\ & & & 1 \end{bmatrix} \right) v \, da \, db \, dx \, dz \quad (5)$$

$$+ q^{-1} \int_{\mathfrak{o}} \int_{\mathfrak{o}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(b) \eta \pi \left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^6 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x\varpi^{-2} & a\varpi^{-2} & b\varpi^{-3} \\ & 1 & & a\varpi^{-2} \\ & & 1 & -x\varpi^{-2} \\ & & & 1 \end{bmatrix} \right) v \, da \, db \, dx \, dz. \quad (6)$$

Proof. In the following computation, we again use the invariance of v under $\mathrm{GSp}(4, \mathfrak{o})$ together with the useful identity (2).

This completes the preliminary calculation of the third term. \square

The following three lemmas calculate the straightforward terms from the decomposition in Lemma 4.1. The strategy in each case is to conjugate by the integral lower triangular matrix, use the invariance of v under $\mathrm{GSp}(4, \mathfrak{o})$, and apply appropriate changes of variables.

Lemma 4.2. *If $v \in V(0)$, then we have that (4) is given by*

$$\begin{aligned}
&q \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(b) \eta \pi \left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^4 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x\varpi^{-2} & a\varpi^{-2} & b\varpi^{-3} \\ & 1 & & a\varpi^{-2} \\ & & 1 & -x\varpi^{-2} \\ & & & 1 \end{bmatrix} \right) v \, da \, db \, dx \, dz \\
&= (q-1) \int_{\mathfrak{o}} \int_{\mathfrak{o}^\times} \int_{\mathfrak{o}^\times} \chi(b) \eta \pi \left(\begin{bmatrix} 1 & x\varpi^{-2} & a\varpi^{-2} & b\varpi^{-3} \\ & 1 & & a\varpi^{-2} \\ & & 1 & -x\varpi^{-2} \\ & & & 1 \end{bmatrix} \right) v \, da \, db \, dx.
\end{aligned}$$

Proof. We calculate (4) as follows:

$$\begin{bmatrix} 1 & x(1-z)^{-1}\varpi^{-1} & & \\ & 1 & & \\ & & 1 & -x(1-z)^{-1}\varpi^{-1} \\ & & & 1 \end{bmatrix})v dx.$$

Next, we consider the integral (10). For $z \in \mathfrak{o}^\times - (1 + \mathfrak{p})$, it will be helpful to consider the following set $A(z) = -z^{-1}(1-z) + \mathfrak{p}$ in order to apply the useful identity (2). We calculate (10) as follows:

$$\begin{aligned} & q \int_{\mathfrak{o}^\times} \pi \left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x\varpi^{-1} & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -x\varpi^{-1} \\ & & & 1 \end{bmatrix} \right) v dx \\ &= q \int_{A(z)} \pi \left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x\varpi^{-1} & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -x\varpi^{-1} \\ & & & 1 \end{bmatrix} \right) v dx \\ &+ q \int_{\mathfrak{o}^\times - A(z)} \pi \left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x\varpi^{-1} & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -x\varpi^{-1} \\ & & & 1 \end{bmatrix} \right) v dx \\ &= \int_{\mathfrak{o}} \pi \left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x - z^{-1}(1-z)\varpi^{-1} & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -(x - z^{-1}(1-z)\varpi^{-1}) \\ & & & 1 \end{bmatrix} \right) v dx \\ &+ q \int_{\mathfrak{o}^\times - A(z)} \pi \left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x\varpi^{-1} & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -x\varpi^{-1} \\ & & & 1 \end{bmatrix} \right) v dx \\ &= \int_{\mathfrak{o}} \pi \left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & -z^{-1}(1-z)\varpi^{-1} & \varpi^{-2} & -(1-x\varpi)\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & z^{-1}(1-z)\varpi^{-1} \\ & & & 1 \end{bmatrix} \right) v dx \\ &+ q \int_{\mathfrak{o}^\times - A(z)} \pi \left(\begin{bmatrix} 1 & (1-z+zx)^{-1}\varpi^{-2} & (x-1)(1-z+zx)^{-1}\varpi^{-3} \\ & 1 & (1-z+zx)^{-1}\varpi^{-2} \\ & -z(1-z+zx)^{-1}\varpi^{-1} & \\ & & 1 & \end{bmatrix} \right) v dx \\ &\left[\begin{bmatrix} 1 & (1-z)^{-1}x\varpi^{-1} & & \\ & 1 & & \\ & & 1 & -(1-z)^{-1}x\varpi^{-1} \\ & & & 1 \end{bmatrix} \right. \\ &\left. \begin{bmatrix} (1-z)^{-1} & & & \\ -z(1-z+zx)^{-1}\varpi & (1-z+zx)^{-1}(1-z) & & \\ zx(1-z)^{-1}\varpi^2 & zx^2(1-z)^{-1}\varpi & (1-z)^{-1}(1-z+zx) & \\ z\varpi^3 & zx\varpi^2 & z\varpi & 1-z \end{bmatrix} \right) v dx \end{aligned}$$

The identities from the next lemma will be used in the calculation of the remaining term (8).

Lemma 4.6. *Let $v \in V(0)$ and $z \in 1 + \mathfrak{p}$.*

(1) *Assume that $x \in \mathfrak{o}^\times$. Then:*

$$\begin{aligned}
&\pi \left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x\varpi^{-2} & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -x\varpi^{-2} \\ & & & 1 \end{bmatrix} \right) v \\
&= \pi \left(\begin{bmatrix} \varpi^{-1} & & & \\ & \varpi^2 & & \\ & & \varpi^{-2} & \\ & & & \varpi \end{bmatrix} \begin{bmatrix} 1 & & (xz)^{-1}\varpi^{-2} & z^{-1}\varpi^{-1} \\ & 1 & -z(xz + (1-z)\varpi)^{-1}\varpi^{-4} & (xz)^{-1}\varpi^{-2} \\ & & 1 & \\ & & & 1 \end{bmatrix} \right) v.
\end{aligned}$$

(2) Assume that $x \in \mathfrak{o}^\times$. Then:

$$\begin{aligned} & \pi\left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x\varpi^{-1} & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -x\varpi^{-1} \\ & & & 1 \end{bmatrix}\right)v \\ &= \pi\left(\begin{bmatrix} \varpi^{-1} & & & \\ & \varpi & & \\ & & \varpi^{-1} & \\ & & & \varpi \end{bmatrix} \begin{bmatrix} 1 & (1-z+zx)^{-1}\varpi^{-2} & -z^{-2}(1-z+x)^{-1}\varpi^{-1}+z^{-1}\varpi^{-1} \\ 1 & -(1-z+zx)^{-1}z\varpi^{-3} & (1-z+zx)^{-1}\varpi^{-2} \\ & 1 & \\ & & 1 \end{bmatrix}\right)v. \end{aligned}$$

(3) Assume that $x \in (1-z^{-1})\varpi^{-1} + \mathfrak{o}^\times$. Then:

$$\begin{aligned} & \pi\left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -x \\ & & & 1 \end{bmatrix}\right)v \\ &= \pi\left(\begin{bmatrix} \varpi^{-1} & & & \\ & 1 & & \\ & & 1 & \\ & & & \varpi \end{bmatrix} \begin{bmatrix} 1 & -z^{-1}w^{-1}\varpi^{-2} & (1+zw\varpi)z^{-2}w^{-1}\varpi^{-2} \\ & 1 & w^{-1}\varpi^{-2} & -z^{-1}w^{-1}\varpi^{-2} \\ & & 1 & \\ & & & 1 \end{bmatrix}\right)v \end{aligned}$$

where $w = (1-x\varpi-z^{-1})\varpi^{-1} \in \mathfrak{o}^\times$.

(4) Assume that $x \in (1-z^{-1})\varpi^{-1} + \varpi\mathfrak{o}^\times$. Then:

$$\begin{aligned} & \pi\left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -x \\ & & & 1 \end{bmatrix}\right)v \\ &= \pi\left(\begin{bmatrix} \varpi^{-1} & & & \\ & \varpi^{-1} & & \\ & & \varpi & \\ & & & \varpi \end{bmatrix} \begin{bmatrix} 1 & -z^{-1}\varpi^{-1} & & \\ & 1 & & \\ & & 1 & z^{-1}\varpi^{-1} \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & & z^{-1}\varpi^{-1} \\ & 1 & w^{-1}\varpi^{-1} \\ & & 1 \\ & & & 1 \end{bmatrix}\right)v \end{aligned}$$

where $w = (1-x\varpi-z^{-1})\varpi^{-2} \in \mathfrak{o}^\times$.

(5) Assume that $x \in (1-z^{-1})\varpi^{-1} + \mathfrak{p}^2$. Then:

$$\begin{aligned} & \pi\left(\begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -x \\ & & & 1 \end{bmatrix}\right)v \\ &= \pi\left(\begin{bmatrix} \varpi^{-1} & & & \\ & \varpi^{-2} & & \\ & & \varpi^2 & \\ & & & \varpi \end{bmatrix} \begin{bmatrix} 1 & -z^{-1}\varpi^{-2} & & \varpi^{-1} \\ & 1 & & z^{-1}\varpi^{-2} \\ & & 1 & \\ & & & 1 \end{bmatrix}\right)v. \end{aligned}$$

Proof. To prove the first assertion, we note that we have the matrix identity

$$\begin{aligned}
& \begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x\varpi^{-2} & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -x\varpi^{-2} \\ & & & 1 \end{bmatrix} \\
&= \begin{bmatrix} \varpi^{-1} & & & \\ & \varpi^2 & & \\ & & \varpi^{-2} & \\ & & & \varpi \end{bmatrix} \begin{bmatrix} 1 & & (xz)^{-1}\varpi^{-2} & z^{-1}\varpi^{-1} \\ & 1 & -z(xz + (1-z)\varpi)^{-1}\varpi^{-4} & (xz)^{-1}\varpi^{-2} \\ & & 1 & \\ & & & 1 \end{bmatrix} \\
& \begin{bmatrix} -x^{-1} & & -(xz)^{-1} & \\ & -(1-z)(xz + (1-z)\varpi)^{-1}x^{-1}\varpi^{-1} & & \\ & & \varpi^2 & \\ z\varpi^2 & zx & z & (1-z)\varpi^{-1} \end{bmatrix}
\end{aligned}$$

where the last matrix is in $\mathrm{GSp}(4, \mathfrak{o})$.

For the second assertion, we have a similar identity

$$\begin{aligned}
& \begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x\varpi^{-1} & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -x\varpi^{-1} \\ & & & 1 \end{bmatrix} \\
&= \begin{bmatrix} \varpi^{-1} & & & \\ & \varpi & & \\ & & \varpi^{-1} & \\ & & & \varpi \end{bmatrix} \begin{bmatrix} 1 & & (1-z+zx)^{-1}\varpi^{-2} & -z^{-2}(1-z+x)^{-1}\varpi^{-1} + z^{-1}\varpi^{-1} \\ & 1 & -(1-z+zx)^{-1}z\varpi^{-3} & (1-z+zx)^{-1}\varpi^{-2} \\ & & 1 & \\ & & & 1 \end{bmatrix} \\
& \begin{bmatrix} \frac{\varpi}{z(x+1-z)} & \frac{x}{z(x+1-z)} & \frac{(z-1)^2}{z(x+1-z)(xz+1-z)\varpi} & \frac{-(z-1)^3}{z^2(x+1-z)(xz+1-z)\varpi^2} \\ -z(xz+1-z) & \frac{(1-z)}{(xz+1-z)\varpi} & & \\ z\varpi^2 & xz\varpi & \varpi & -x \\ & & z & (1-z)\varpi^{-1} \end{bmatrix}
\end{aligned}$$

where the last matrix is again in $\mathrm{GSp}(4, \mathfrak{o})$.

For the third assertion, recall that $x \in (1-z^{-1})\varpi^{-1} + \mathfrak{o}^\times$ and $w = (1-x\varpi - z^{-1})\varpi^{-1} \in \mathfrak{o}^\times$. Then we have the identity

$$\begin{aligned}
& \begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -x \\ & & & 1 \end{bmatrix} \\
&= \begin{bmatrix} \varpi^{-1} & & & \\ & 1 & & \\ & & 1 & \\ & & & \varpi \end{bmatrix} \begin{bmatrix} 1 & & -z^{-1}w^{-1}\varpi^{-2} & (1+zw\varpi)z^{-2}w^{-1}\varpi^{-2} \\ & 1 & w^{-1}\varpi^{-2} & -z^{-1}w^{-1}\varpi^{-2} \\ & & 1 & \\ & & & 1 \end{bmatrix}
\end{aligned}$$

$$\begin{bmatrix} -(zw)^{-1} & -x(zw)^{-1} & & \\ w^{-1} & (z-1)(zw)^{-1}\varpi^{-1} & & \\ & & 1 & -x \\ z\varpi^2 & xz\varpi^2 & z & (1-z)\varpi^{-1} \end{bmatrix}$$

where the last matrix is again in $\mathrm{GSp}(4, \mathfrak{o})$.

For the fourth assertion, recall that $x \in (1 - z^{-1})\varpi^{-1} + \varpi\mathfrak{o}^\times$ and $w = (1 - x\varpi - z^{-1})\varpi^{-2} \in \mathfrak{o}^\times$. Then we have the identity

$$\begin{aligned} & \begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -x \\ & & & 1 \end{bmatrix} \\ &= \begin{bmatrix} \varpi^{-1} & & & \\ & \varpi^{-1} & & \\ & & \varpi & \\ & & & \varpi \end{bmatrix} \begin{bmatrix} 1 & -z^{-1}\varpi^{-1} & & \\ & 1 & & \\ & & 1 & z^{-1}\varpi^{-1} \\ & & & 1 \end{bmatrix} \begin{bmatrix} 1 & & & z^{-1}\varpi^{-1} \\ & 1 & w^{-1}\varpi^{-1} & \\ & & 1 & \\ & & & 1 \end{bmatrix} \\ & \begin{bmatrix} w^{-1} & (1 - z^{-1})w^{-1}\varpi^{-1} & & \\ -\varpi & -x\varpi & & w \\ z\varpi^2 & xz\varpi^2 & z & (1 - z)\varpi^{-1} \end{bmatrix} \end{aligned}$$

where the last matrix is again in $\mathrm{GSp}(4, \mathfrak{o})$.

For the final assertion, recall that $x \in (1 - z^{-1})\varpi^{-1} + \mathfrak{p}^2$. Then we have the identity

$$\begin{aligned} & \begin{bmatrix} 1 & & & \\ & 1 & & \\ & & 1 & \\ z\varpi^3 & & & 1 \end{bmatrix} \begin{bmatrix} 1 & x & \varpi^{-2} & -\varpi^{-3} \\ & 1 & & \varpi^{-2} \\ & & 1 & -x \\ & & & 1 \end{bmatrix} \\ &= \begin{bmatrix} \varpi^{-1} & & & \\ & \varpi^{-2} & & \\ & & \varpi^2 & \\ & & & \varpi \end{bmatrix} \begin{bmatrix} 1 & -z^{-1}\varpi^{-2} & & \varpi^{-1} \\ & 1 & & \\ & & 1 & z^{-1}\varpi^{-2} \\ & & & 1 \end{bmatrix} \\ & \begin{bmatrix} (1-z)\varpi & (1 + (1-z)xz\varpi)z^{-1} & (1-z)\varpi^{-1} & (1-z)^2z^{-1}\varpi^{-2} \\ & \varpi^2 & & 1 \\ -1 & -x & & -(1-z+xz\varpi)z^{-1}\varpi^{-3} \\ z\varpi^2 & xz\varpi^2 & z & (1-z)\varpi^{-1} \end{bmatrix} \end{aligned}$$

where again the last matrix is in $\mathrm{GSp}(4, \mathfrak{o})$. This completes the proof of the lemma. \square

5. CALCULATION OF THE FOURTH PART (P4)

In this section, we compute the final summand of the operator defined in [JR1]. We continue to use the same techniques as in the previous sections, in particular, the invariance of v under $\mathrm{GSp}(4, \mathfrak{o})$ and the useful identity (2).

Lemma 5.1. *If $v \in V(0)$, then we have that (P4) is given by*

$$\begin{aligned}

Proof. For $a, b \in \mathfrak{o}^\times$, define the diagonal matrix

$$C(a, b) = \begin{bmatrix} 1 & & & \\ & a & & \\ & & b & \\ & & & ab \end{bmatrix}.$$

Then we calculate as follows:

$$\begin{aligned}
